1. Introduction

Problem Identified:

- Manual handling of complaints, bookings, and notices is time-consuming and error-prone
- No centralized platform for communication and maintenance tracking
- Residents depend on physical visits or calls, causing delays and miscommunication
- Paper-based records are hard to manage, insecure, and difficult to audit

Solution Proposed:

- Develop a mobile application for complete society management
- Enable residents to raise complaints, book amenities, and view notices digitally
- Provide an Admin Dashboard for centralized control and real-time approvals
- Implement automated financial tracking for transparency in expenses and payments
- Use real-time push notifications for instant communication of important updates

2. Objectives

- To build a user-friendly mobile application for housing society residents and administrators.
- To achieve efficiency in resolving resident complaints and managing amenity bookings.
- To provide a transparent system for tracking society maintenance payments and expenses.
- To eliminate paper-based documentation by providing a secure cloud-based storage for society data.

3. Scope

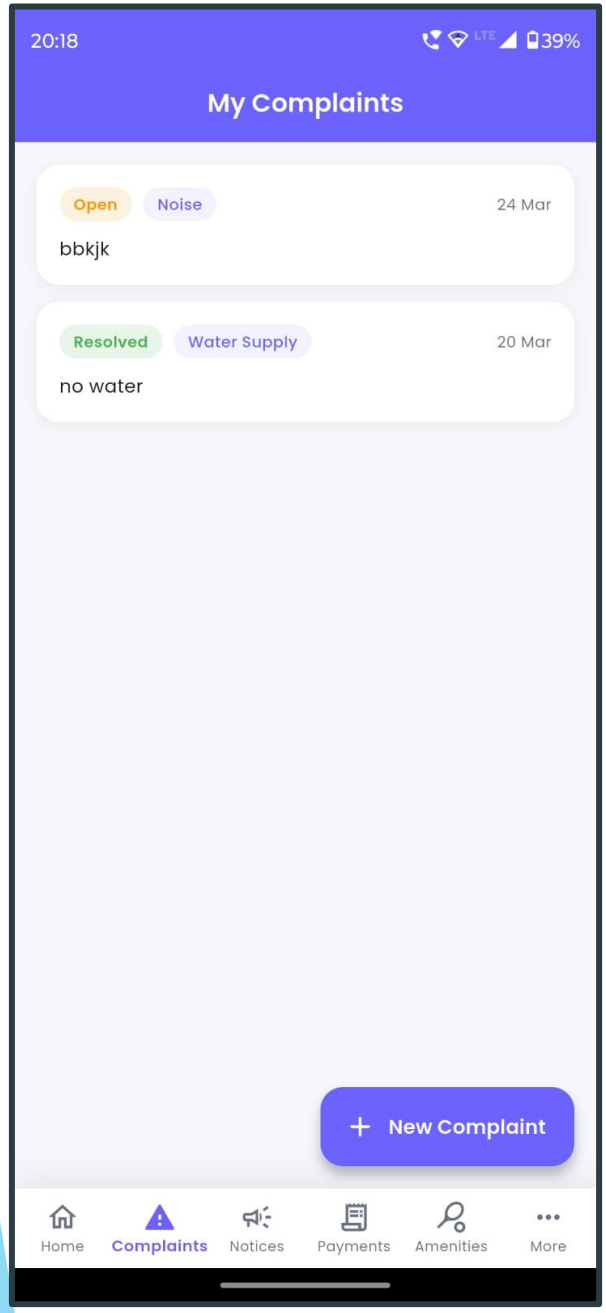
- Urban Housing Societies: Can be applied in large-scale residential complexes to manage high volumes of residents.
- Society Committee Members: Useful for admins to monitor staff performance and society health via a single dashboard.
- Resident Convenience: Provides a 24/7 service portal for residents to interact with management without time constraints.
- Financial Auditing: Can be used by society auditors to pull digital expense reports and payment histories for yearly tax filings.

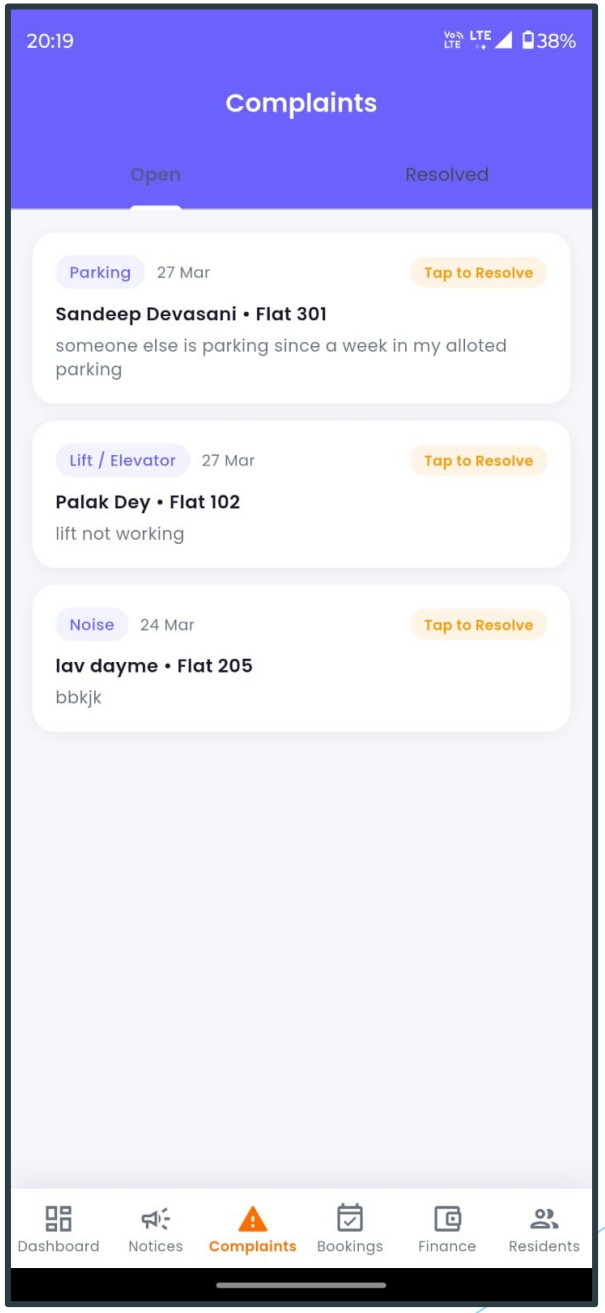
4. Feature /Functionality

- Complaint Tracking: Features a "Tap to Resolve" system where admins can view detailed logs of issues like "Lift/Elevator" or "Parking" and update their status in real-time.
- Amenity Management: Residents can view a catalog of facilities (Gym, Swimming Pool, Tennis Court) and see their booking status as "Approved" or "Pending".
- Digital Notice Board: Admins can "Post Notice" with specific dates and times, which appear instantly on the resident’s home screen under "Recent Notices".
- Finance Module: Includes a payment interface showing "Total Maintenance Paid" and a breakdown of "Monthly Collection" versus "Expenses".

4. Feature /Functionality

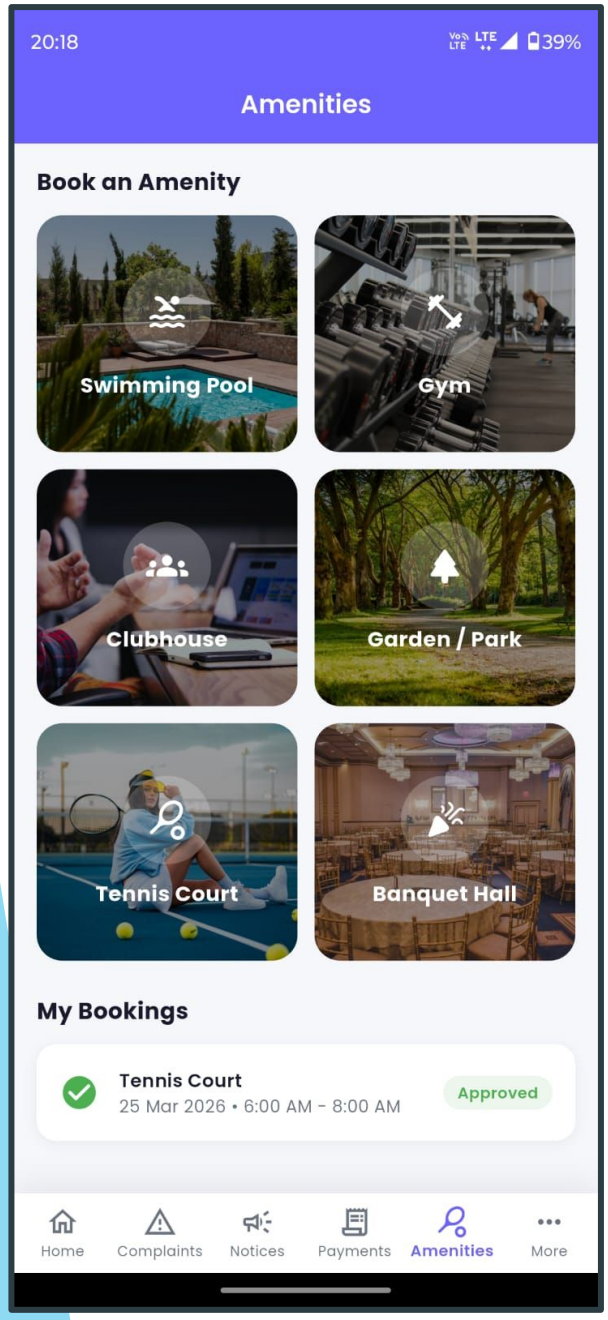
1. Complaint Tracking

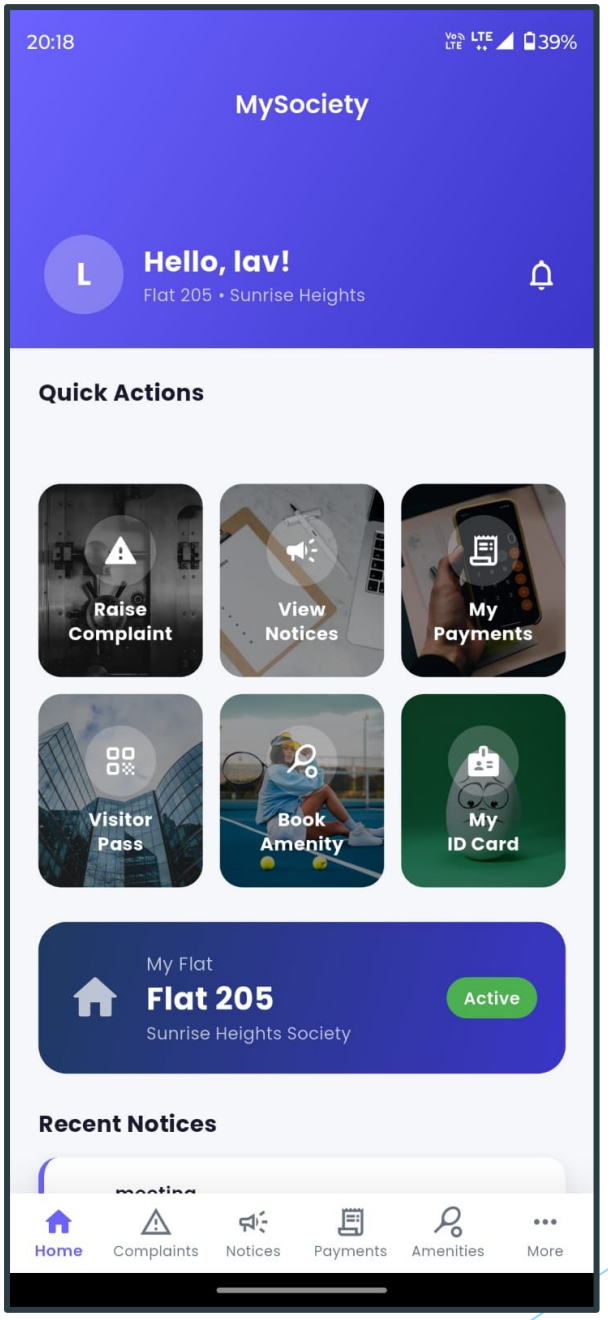


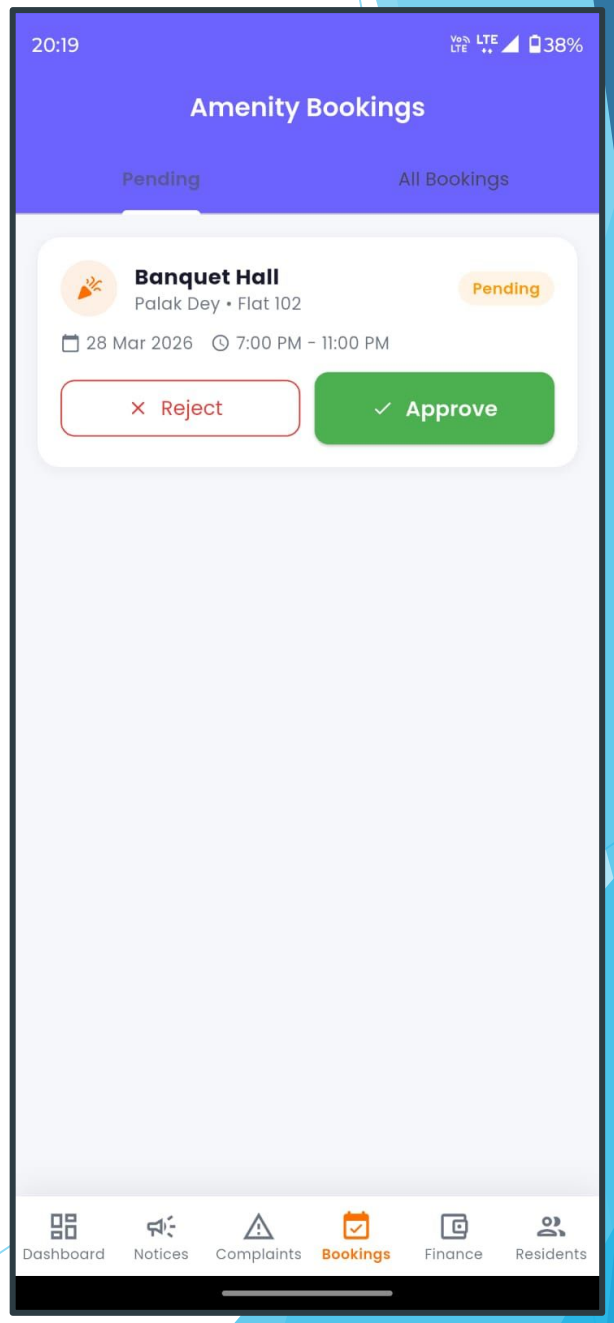


4. Feature /Functionality

2. Amenity Management

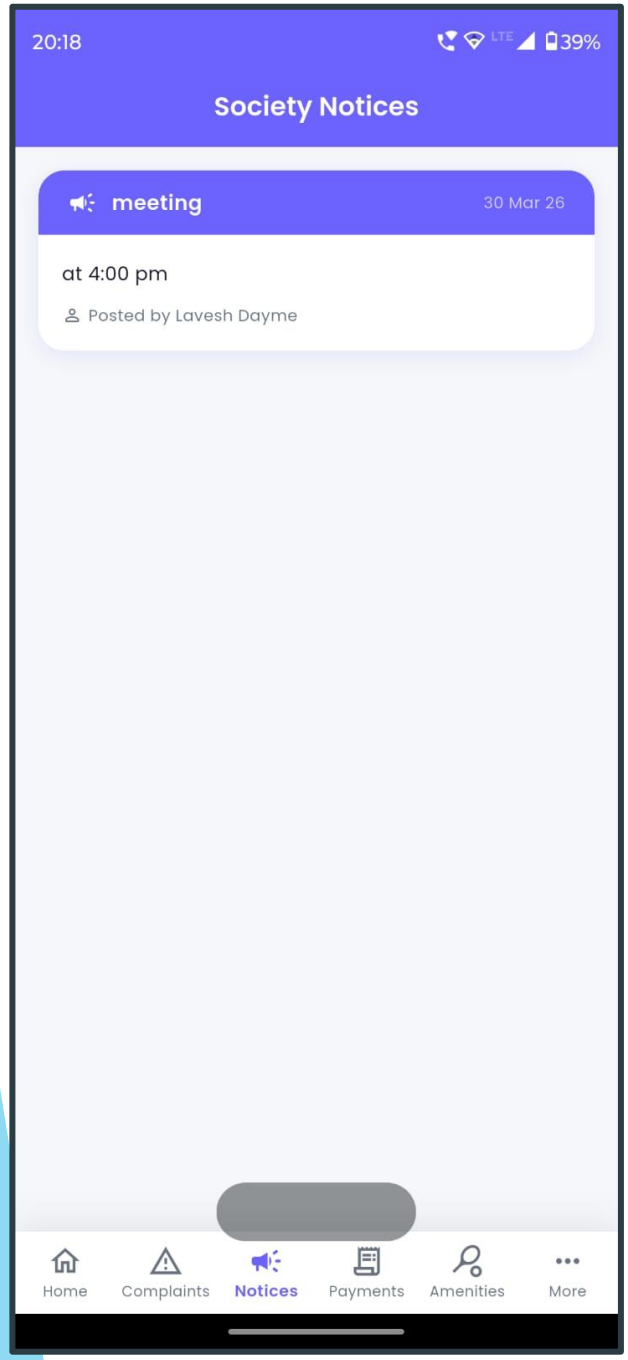


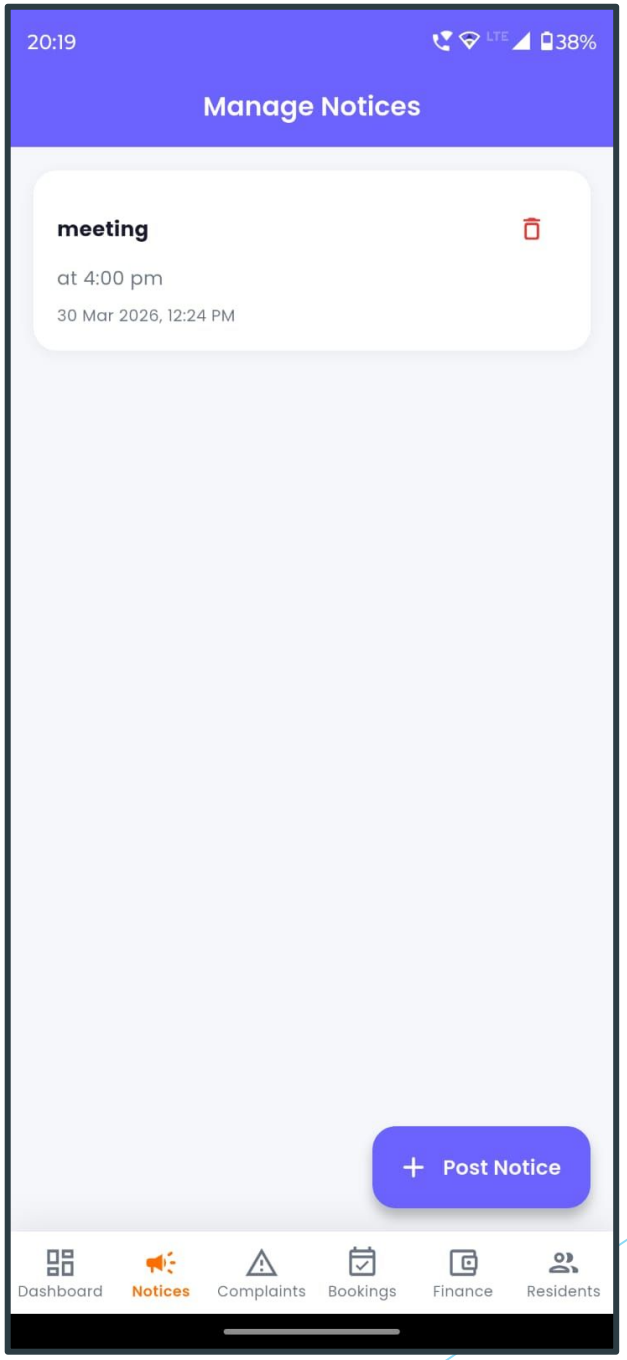




4. Feature /Functionality

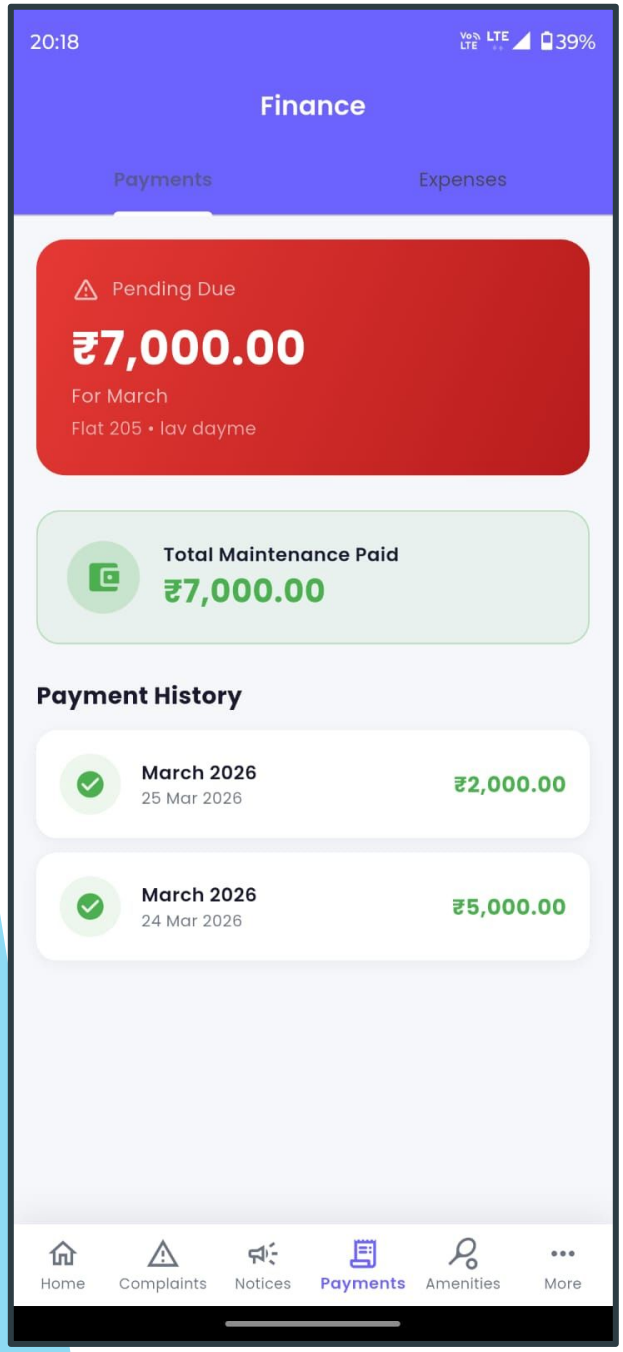
3. Digital Notice Board

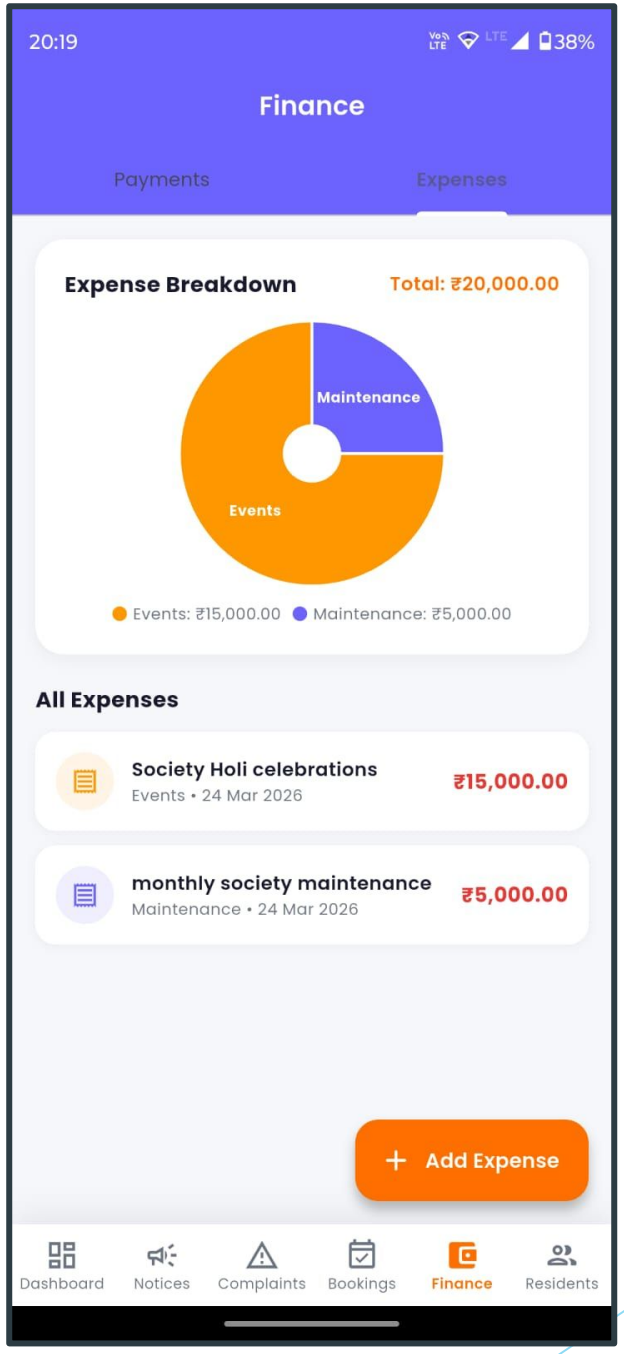


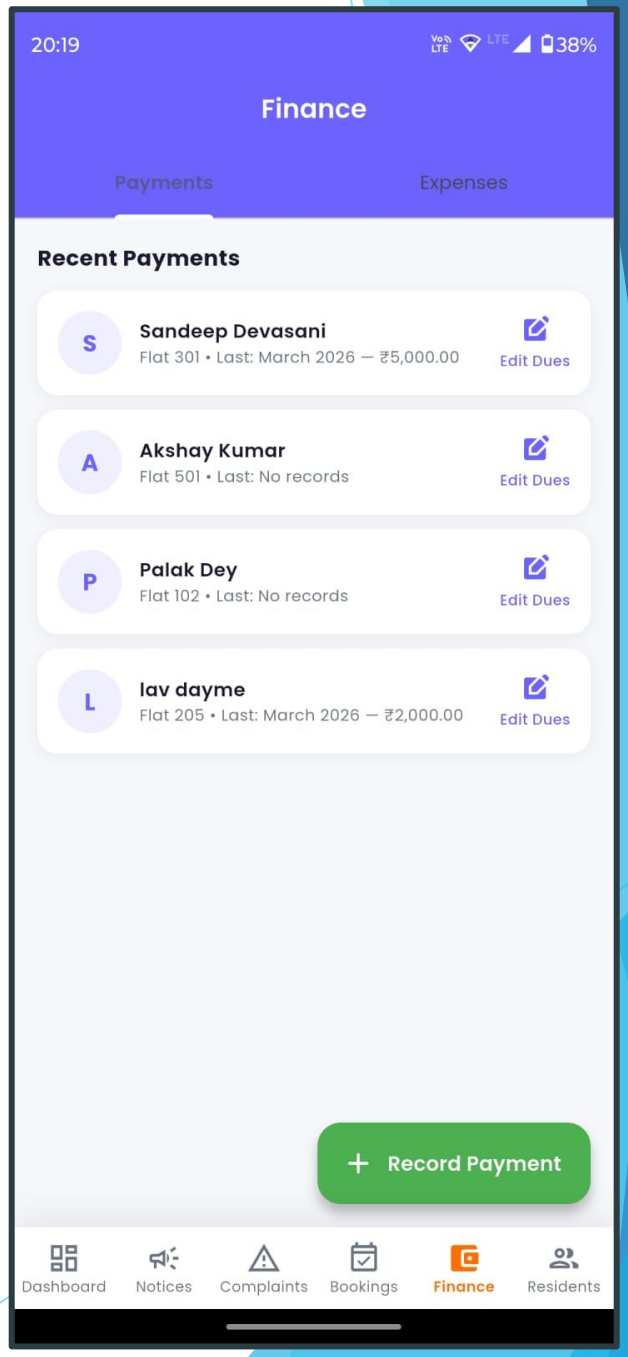


4. Feature /Functionality

4. Finance Module







5. Technology Stack

- Frontend (GUI): Flutter (Dart) for a responsive and modern user interface.
- Backend (Database): Firebase / Firestore for real-time data synchronization and secure hosting.
- Authentication: Firebase Auth to manage secure login credentials for different user roles.

6. SDGs Used

SDG 9: Industry, Innovation & Infrastructure

Builds digital infrastructure for housing societies using Flutter and Firebase, replacing manual systems with an innovative, centralized platform.

SDG 11: Sustainable Cities & Communities

Directly improves management of residential societies, making communities more organized, safe, and sustainable through better coordination.

7. Outcome of Project

- Role-Based Access: Admins and Residents have separate interfaces; Admins see a "Control Panel" while residents see a "Service Home".
- Instant Status Transparency: Residents can check the progress of their complaints (e.g., "Open" vs "Resolved") without calling the office.
- Simplified Bookings: Users can book facilities by selecting the specific amenity and providing the required date and time slots.
- Digital Financial Records: The system generates a clear "Payment History" for every flat, reducing disputes over maintenance dues.
